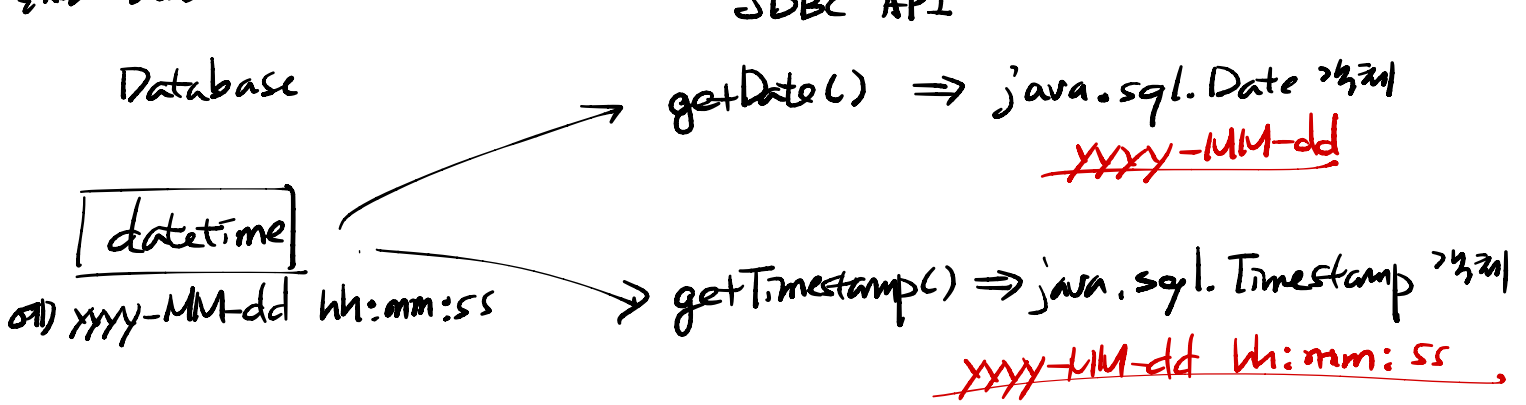
40. DBMS 활용하기(계속)

* 날짜 관련된 함수



4. 외부키(foreign key) 사용

myapp_users

user_id	name	email	pwd	created_date
1	aaa	-	-	-
2	bbb	-	-	-
3	ccc	-	-	-

myapp_projects

project_id	title	description	startdate	enddate	members
101	p1	-	-	-	1,3
102	p2	-	-	-	1,2
103	p3	-	-	-	1,2,3

1번회원 삭제

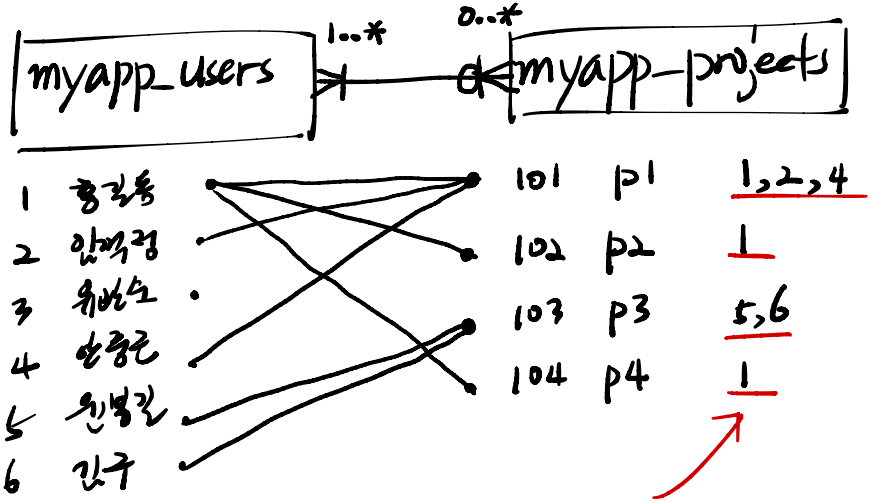
프로젝트 테이블의
멤버 변경과 무관한 변경과 된다

무결성이 깨진다!
↳ 결함 발생!

4. 외부키(foreign key) 사용

1) 테이블의 데이터간에 관계를 파악

(다 대 다 관계)

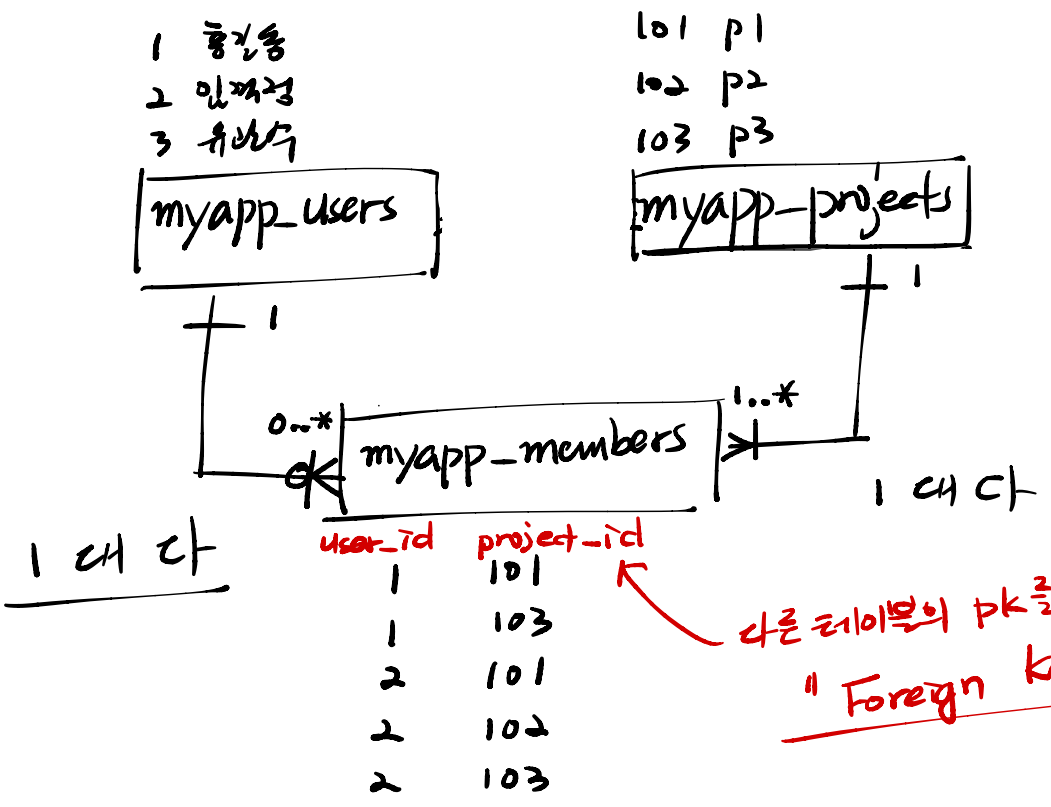


(1 대 다 / 다 대 다) 관계를 위와 같이 하나의 컬럼에 저장하면 무결한 데이터 입력을 막을 수 없다

Foreign key 제약조건 + 다대다의 경우 별도 테이블로 관리

해결?

* 다대다 관계를 다루기

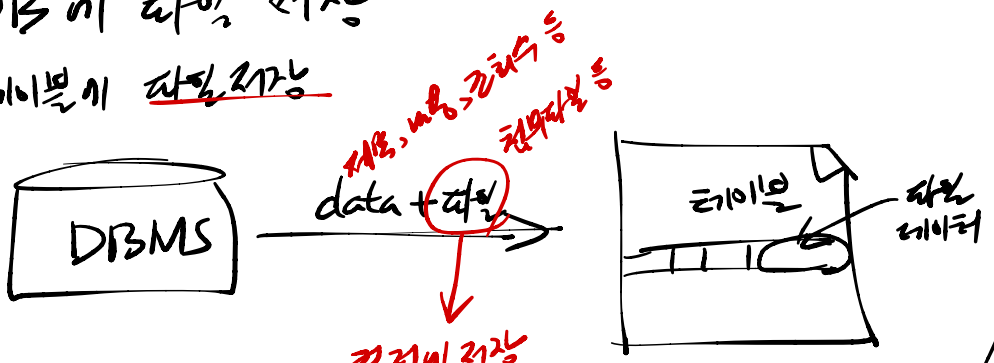


★ 외부키 (foreign key)

- 다른 테이블의 pk를 가리킴
- 없는 pk를 저장할 수 없음

* DB에 파일 저장

① 테이블에 파일저장



컬럼에 저장

↓

데이터베이스가 저장된 (blob 타입으로 저장)

⇓

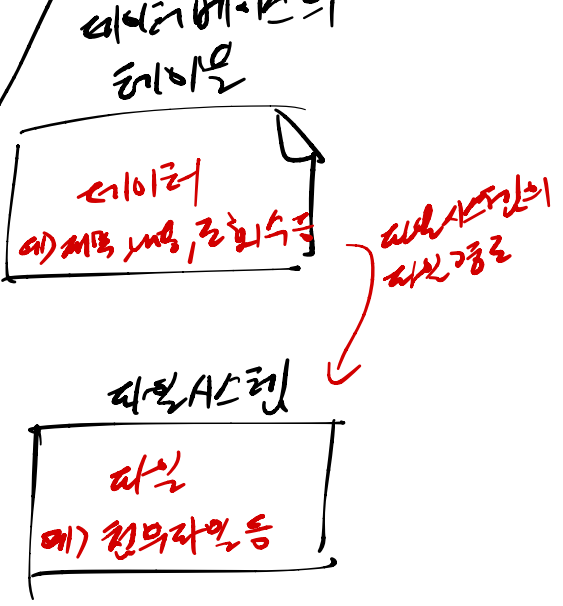
파일 안에 데이터 저장하는 방식

⇓

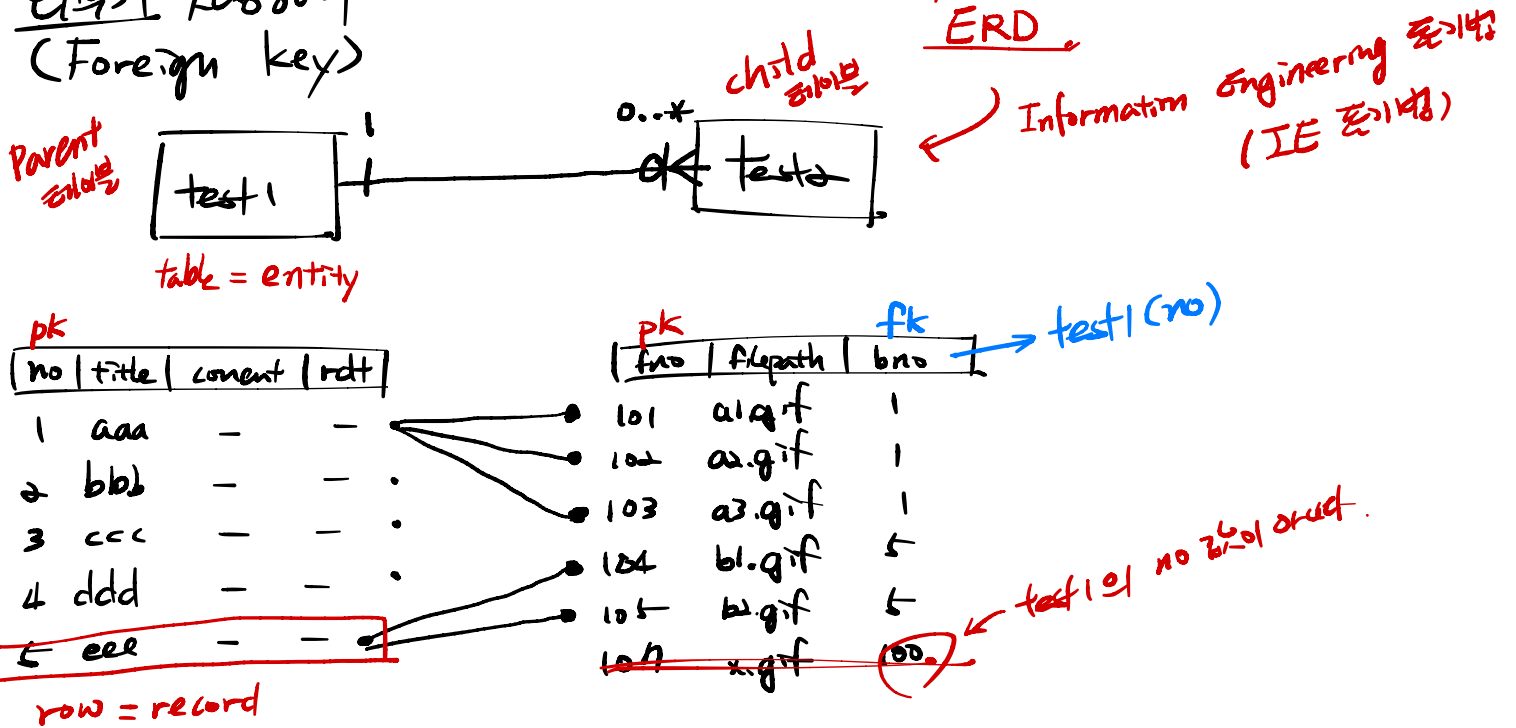
파일을 읽는 속도 매우 느려짐

하지만?

② 파일을 분리해서 저장



4. 외래키 사용하기 (Foreign key)



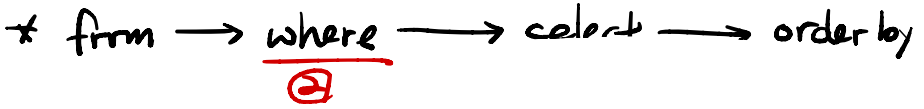
* from → where → select → order by

① ②

```
mysql> select * from room;
+-----+--------+------+------+
| rno | loc    | name | qnty |
+-----+--------+------+------+
|   1 | 강남   | 501  |   30 |
|   2 | 강남   | 502  |   30 |
|   3 | 강남   | 503  |   30 |
|   4 | 종로   | 301  |   30 |
|   5 | 종로   | 302  |   30 |
|   6 | 종로   | 303  |   30 |
|   7 | 서초   | 301  |   30 |
|   8 | 서초   | 302  |   30 |
|   9 | 서초   | 501  |   30 |
|  10 | 서초   | 601  |   30 |
+-----+--------+------+------+
```

① ②

```
select rno, name, concat(loc,'-',name) as name2
from room
order by loc asc, name2 asc;
```



```
mysql> select * from room;
+-----+--------+------+------+
| rno | loc    | name | qnty |
+-----+--------+------+------+
|   1 | 강남   | 501  |   30 |
|   2 | 강남   | 502  |   30 |
|   3 | 강남   | 503  |   30 |
|   4 | 종로   | 301  |   30 |
|   5 | 종로   | 302  |   30 |
|   6 | 종로   | 303  |   30 |
|   7 | 서초   | 301  |   30 |
|   8 | 서초   | 302  |   30 |
|   9 | 서초   | 501  |   30 |
|  10 | 서초   | 601  |   30 |
+-----+--------+------+------+
```

```
select rno, name, concat(loc,'-',name) as name2
from room
order by loc asc, name2 asc;
```

* from → where → select → order by

③ ← 결과로 추출할 컬럼 표시 (가상 컬럼 준비

```
③ select rno, name, concat(loc,'-',name) as name2
① from room
order by loc asc, name2 asc;
```

mysql> select * from room;

rno	loc	name	qnty	name2 (loc - name)
1	강남	501	30	강남-501
2	강남	502	30	강남-502

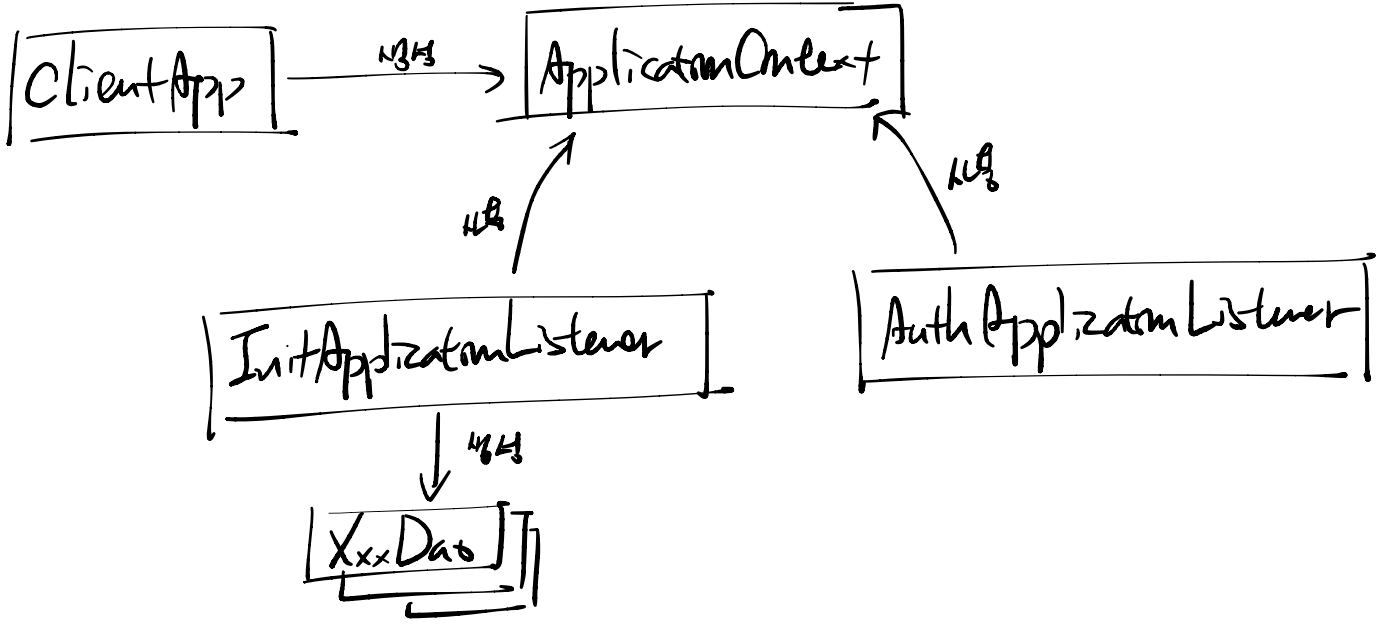
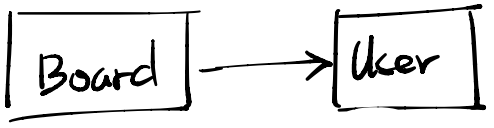
42. 로그인/로그아웃 구현하기

① ApplicationListener 관련 객체 동작



* 게시글 + 작성자



```
class Board {
    int no;
    :
    User writer;
    :
}
```

43. SQL 방법 공개 방식

"insert into x_board (title, contents)
values ('" + title + "', '" + contents + "')"

title = aaa
contents = xxx

"insert into x_board (title, contents) values('aaa', 'xxx')"

* SQL injection 예 1

" insert into x_board (title, contents)
values ('" + title + "', '" + contents + "')"

title = aaa
contents = ~~xxx~~ xxx'), ('bbb', 'yyy'), ('ccc', 'zzz

" insert into x_board (title, contents)
values ('aaa', 'xxx'), ('bbb', 'yyy'), ('ccc', 'zzz')"

* SQL 방법 공격 예2

```
" insert into x_board (title, contents)
values ('" + title + "','" + contents + "')"
```

title = aaa
contents = xxx'),(select user_id from myapp_users where user_id=1),
(select pwd from myapp_users where user_id=1)--

('xxx', 'xxx

```
" insert into x_board (title,contents)
values('aaa','                    ')"
```

* SQL 실행 하기 방법 ⇒ PreparedStatement

PreparedStatement stmt = con.prepareStatement(SQL);

insert into x_board (title, contents) values (?, ?)

In-parameter = 값을 대로 준다

stmt.setString(1, '제목');
stmt.setString(2, '내용');

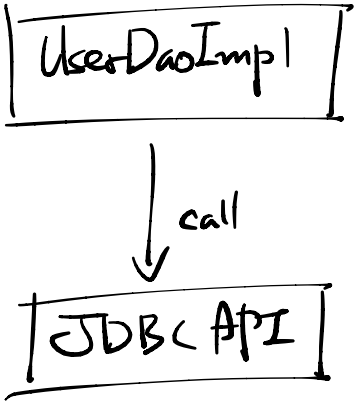
In-parameter에 들어갈 값.

SQL문과 SQL에 넣을 값을 분리!

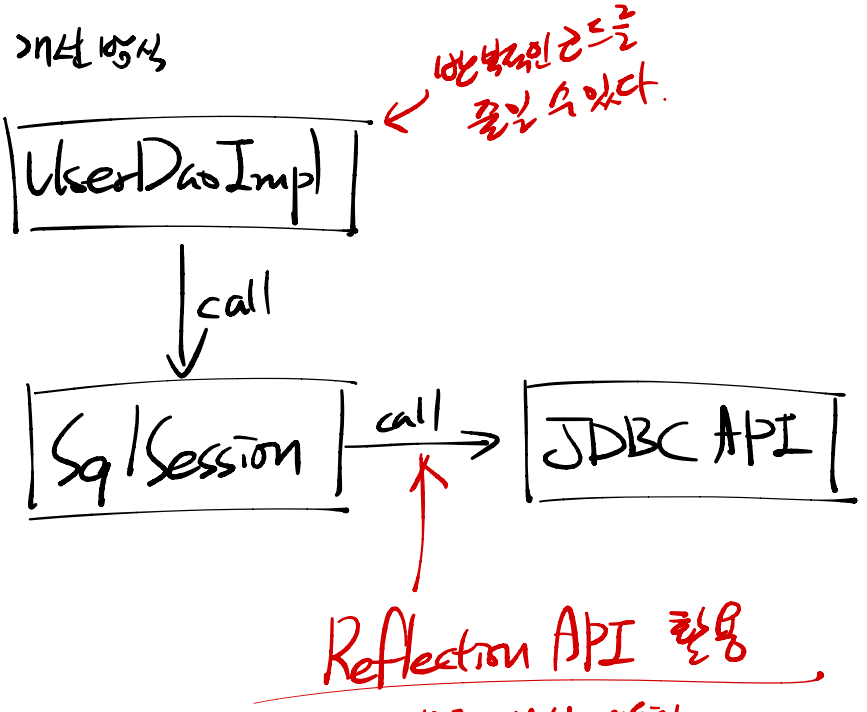
In-parameter 번호 1부터 시작

44. JDBC 코드 캡슐화

① 이전 방식

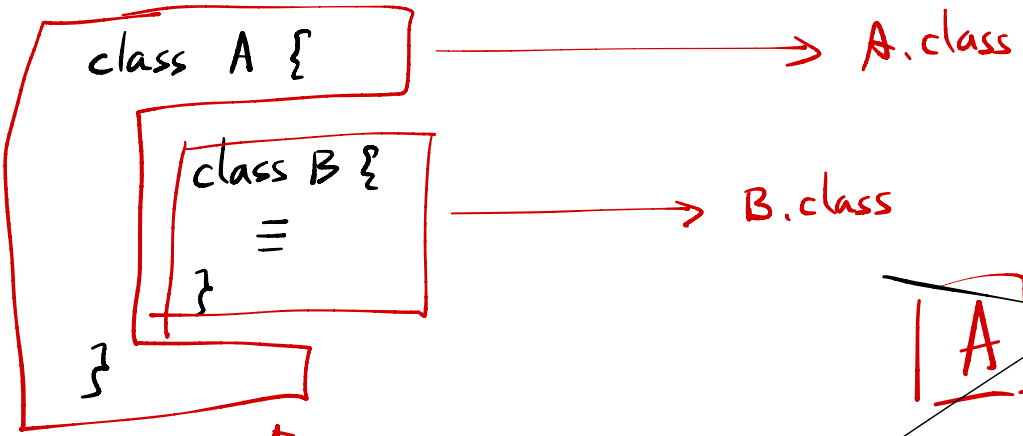


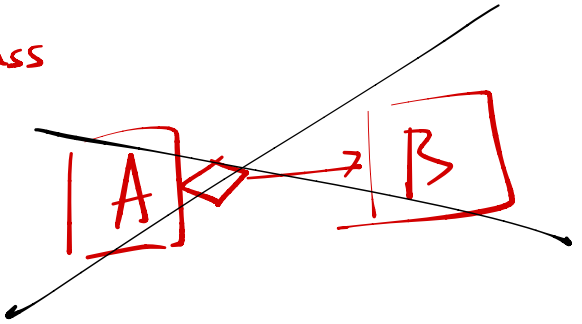
② 개선 방식



* Reflection API

중첩클래스





소스코드에서는 중첩은 B클래스가 A클래스 안에서 사용되는 의미이다

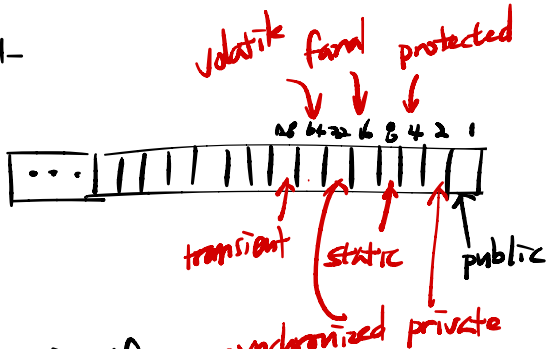
= A는 B를 포함하고 있다 OOOO!

↓

사용범위를 제한하는 문법이다

* 메서드 modifier 비트 연산-

modifier 값



예) public static final float PI = 3.14f;

↳ 00011001(modifier값)

public : 00000001
private : 00000010
protected : 00000100
static : 00001000
final : 00010000
⋮

```
  00011001
& 00000001 (public)
----------
  00000001  > 0
```

```
  00011001
& 00000010 (private)
----------
  00000000  > 0
```

* Field & Property

```
public class User implements Serializable {
  private int no;
  private String name;
  private String email;

  public int getNo() {return no;}
  public void setNo(int no) {this.no = no;}

  public String getName() {return name;}
  public void setName(String name) {this.name = name;}

  public String getEmail() {return email;}
  public void setEmail(String email) {this.email = email;}
}
```

멤버(field)

getter

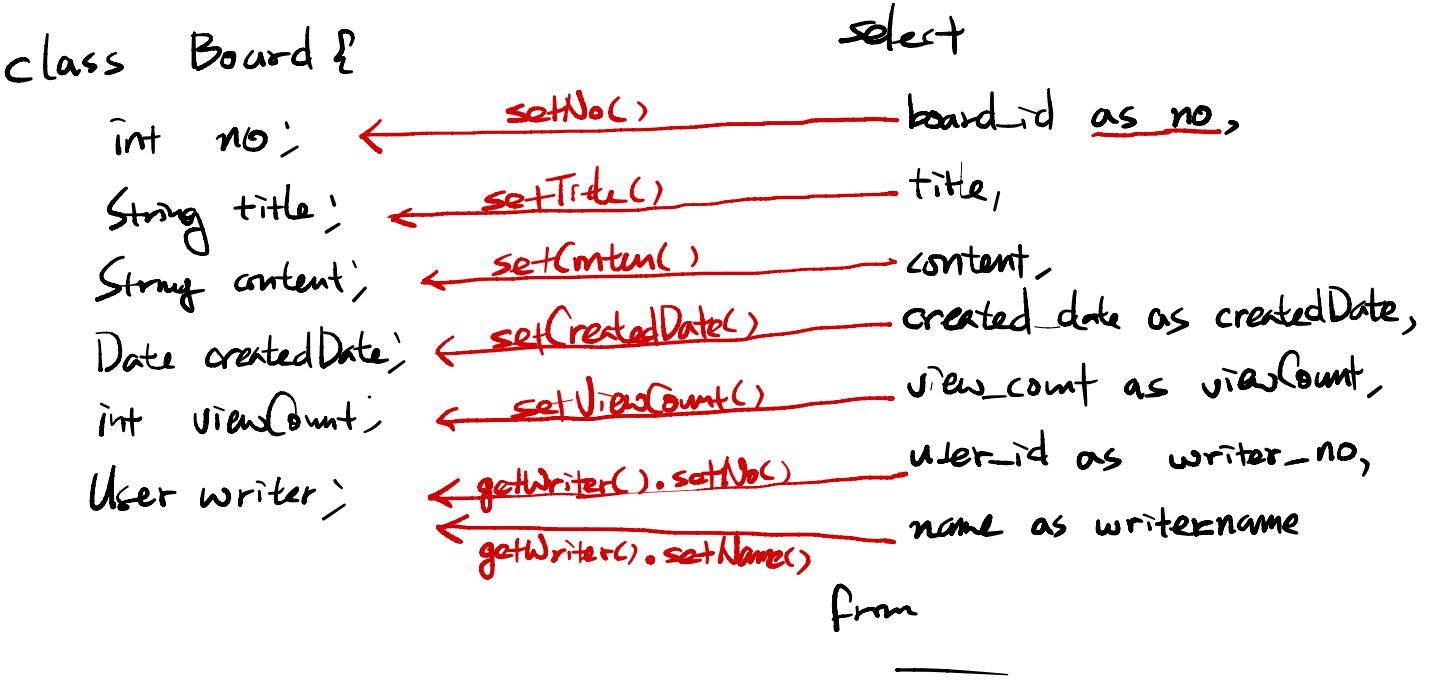
setter

property

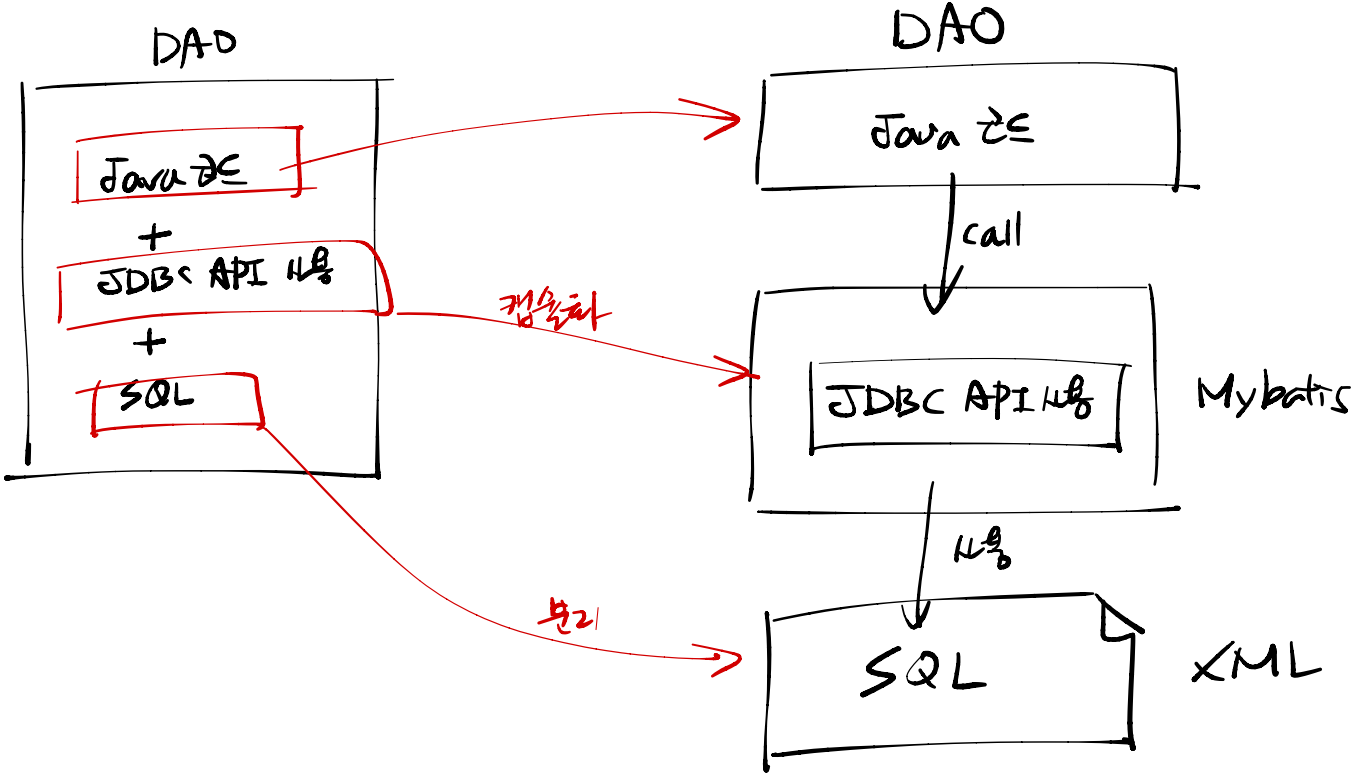
~~setCreateDate() {~}~~

"createDate" ← property name

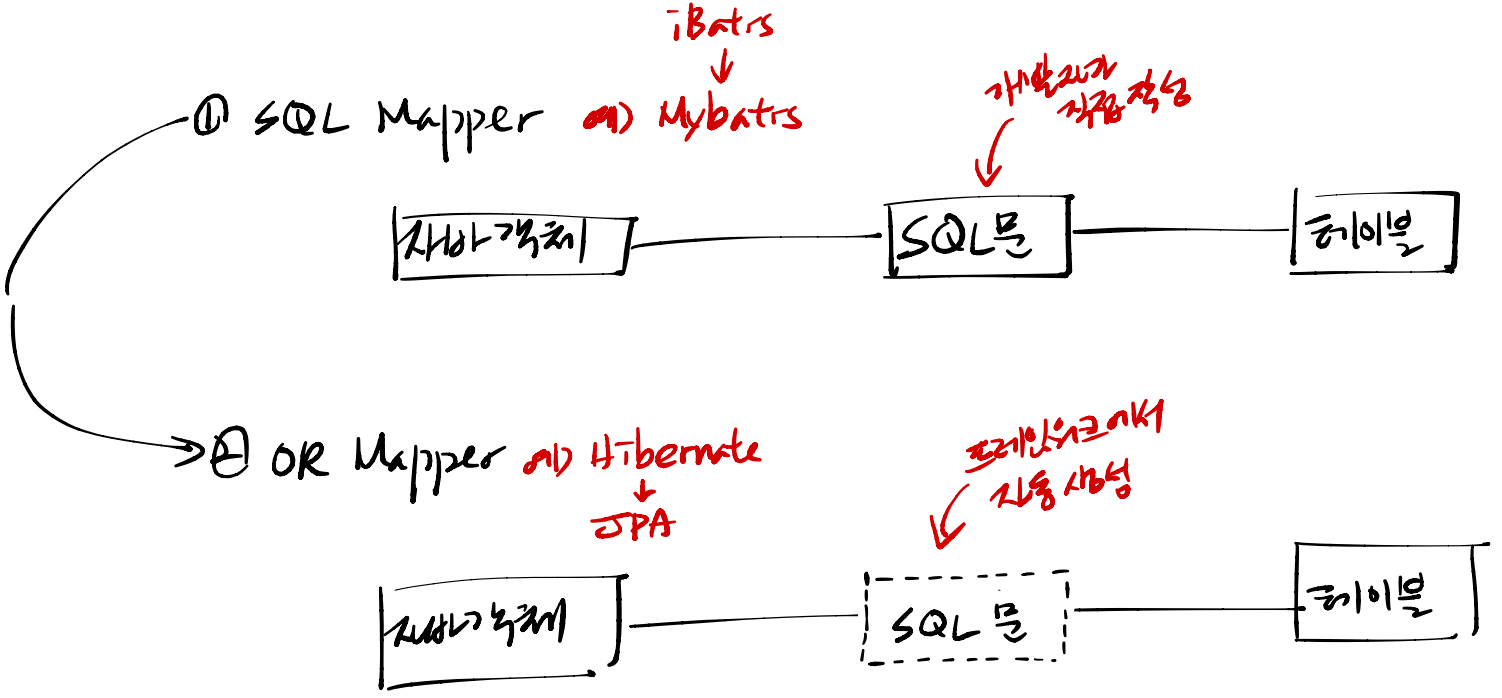
* Field & Property



45. Mybatis 장점



* 퍼시스턴스 프레임워크 (Persistence Framework)



* Mybatis 사용 순서 — ① 설정파일 작성

mybatis-config.xml

-//mybatis.org// DTD ——— //EN

규칙을 만들어 준 회사명 / 규칙을 작성한 언어

+ 국제공인규칙
- 사설규칙

규칙이름

1.0만 가능

문서를 인쇄할때 사용하는 문자인코딩

반드시 첫 줄에 와야 함.

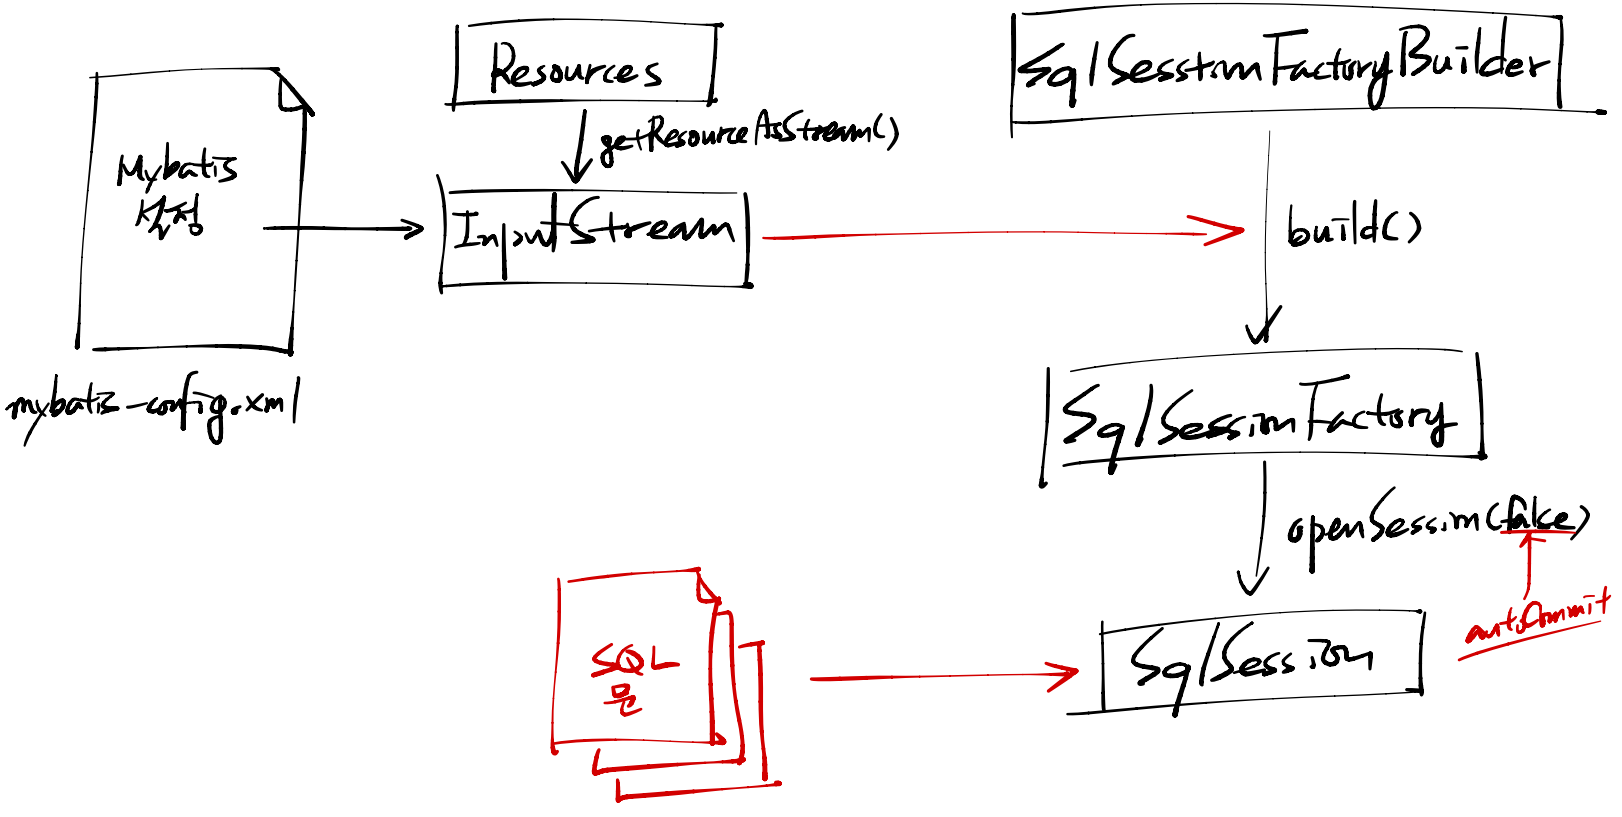
```
<?xml version="1.0" encoding="UTF-8" ?>
```
← XML 선언

```
<!DOCTYPE configuration PUBLIC "-//mybatis.org//DTD Config 3.0//EN" "https://———/—.dtd">
```

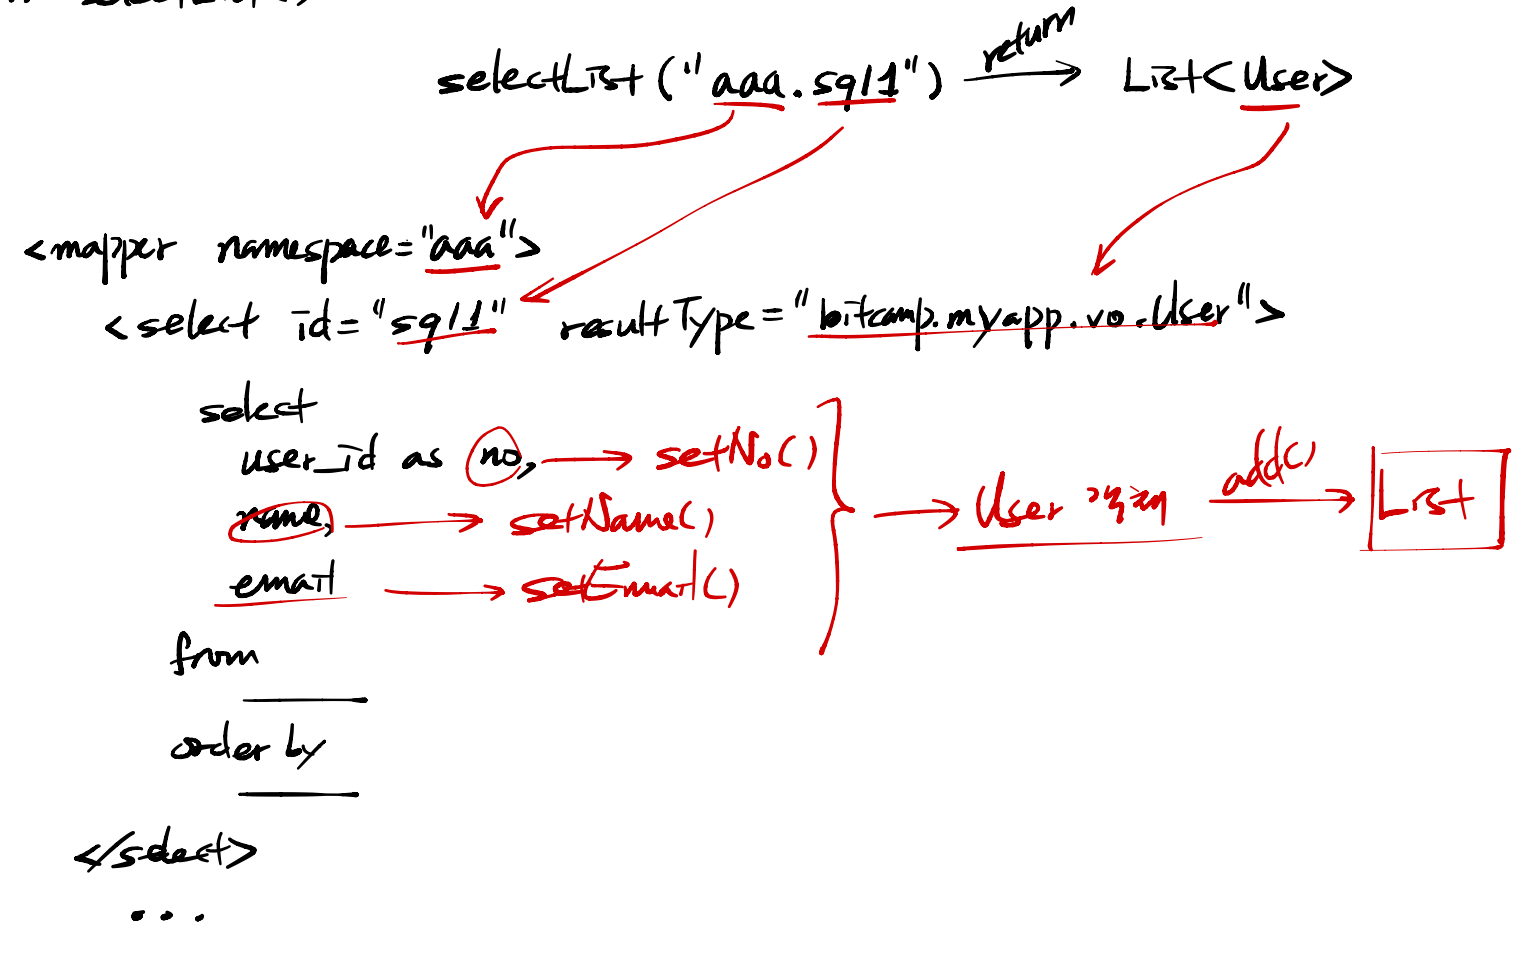
<!DOCTYPE : XML 규칙선언
configuration : root element (태그)
PUBLIC : 공개
SYSTEM (비공개) ← 특정회사에서만 사용하는 규칙일때
"https://———/—.dtd" : 규칙을 정의한 컴퓨터의 URL

```
<configuration>
    |
</configuration>
```
← root element = XML 문서에 한 개만 와야만 함.

* SqlSession 객체 준비

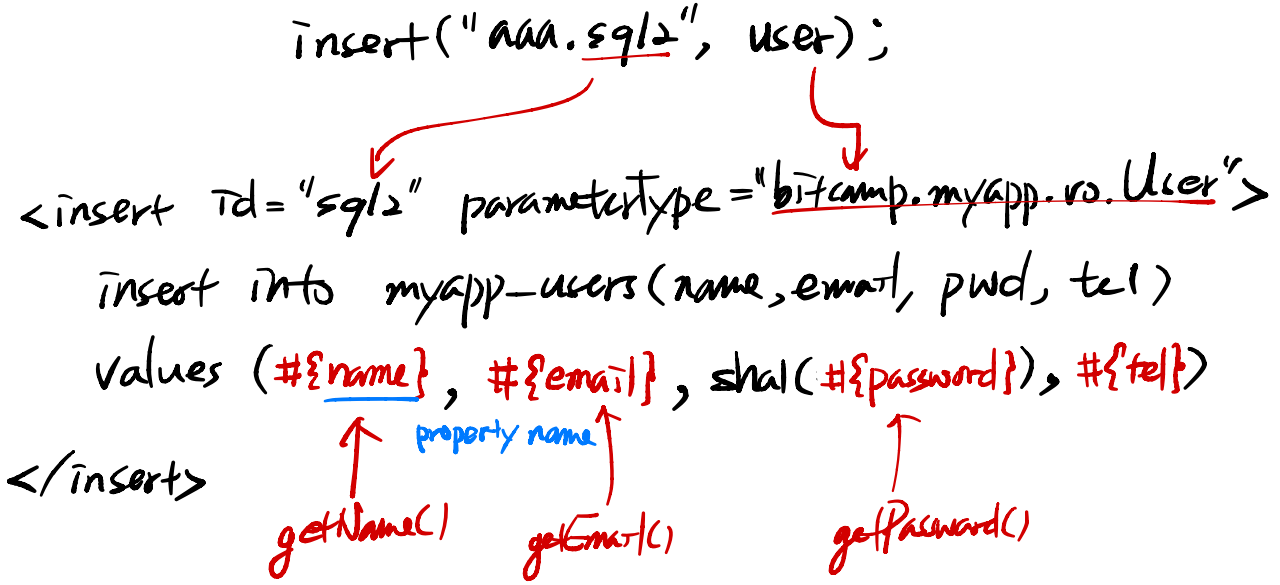


* selectList()



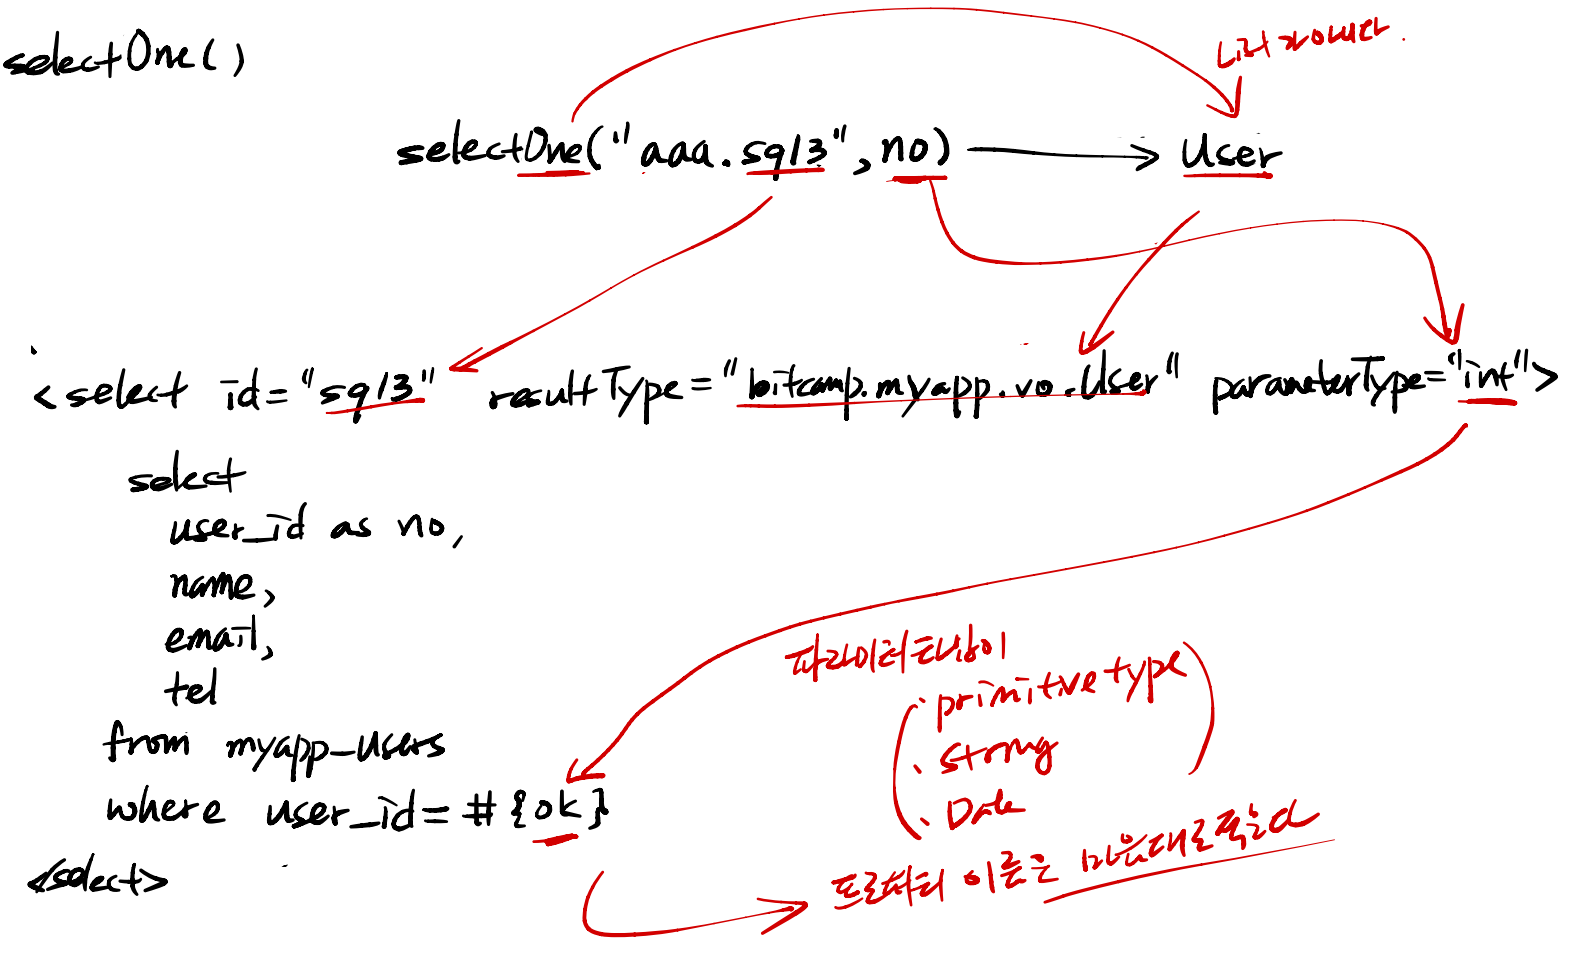
selectList("aaa.sql1") return List<User>
<mapper namespace="aaa">
<select id="sql1" resultType="bitcamp.myapp.vo.User">
select
user_id as no, → setNo()
name → setName()
email → setEmail()
from
order by
</select>
...
→ User 객체 add() → List

* insert()



insert("aaa.sql", user);
<insert id="sql" parameterType="bitcamp.myapp.vo.User">
insert into myapp_users(name, email, pwd, tel)
values (#{name}, #{email}, sha1(#{password}), #{tel})
</insert>
property name
getName()
getEmail()
getPassword()

* selectOne()



selectOne("aaa.sql3", no) → User
<select id="sql3" resultType="bitcamp.myapp.vo.User" parameterType="int">
select
user_id as no,
name,
email,
tel
from myapp_users
where user_id=#{ok}
</select>
파라미터타입이
primitive type
String
Date
프로퍼티 이름은 아무거나 적어도

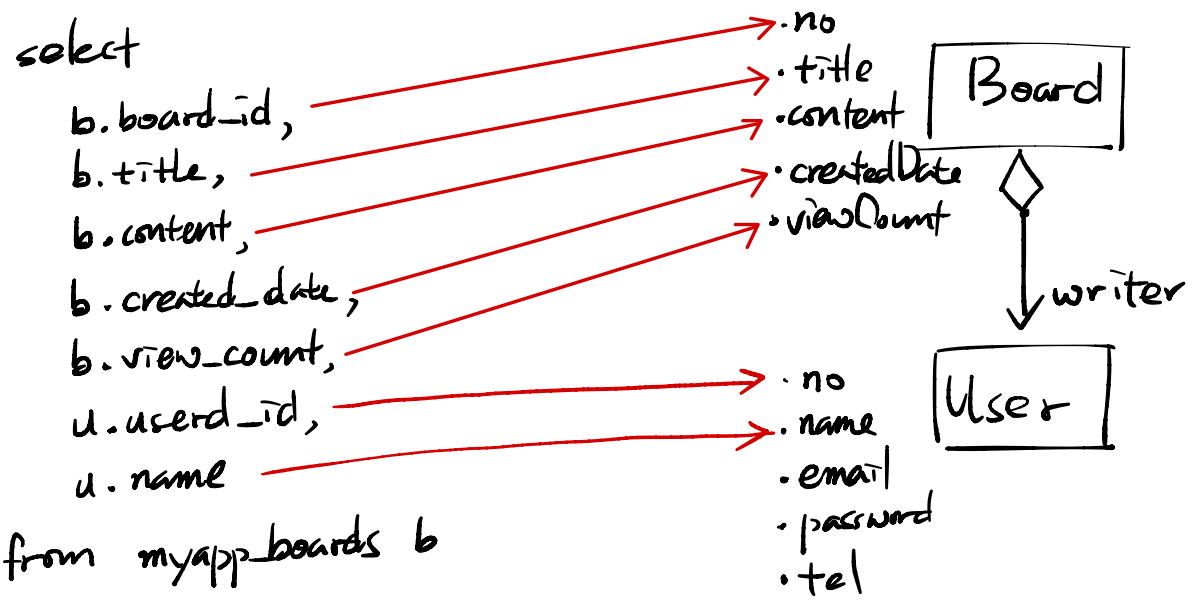
* 트랜잭션 처리

sqlSession.insert()
update()
delete()
} sqlSession.commit()
" .rollback()

UserAddCommand

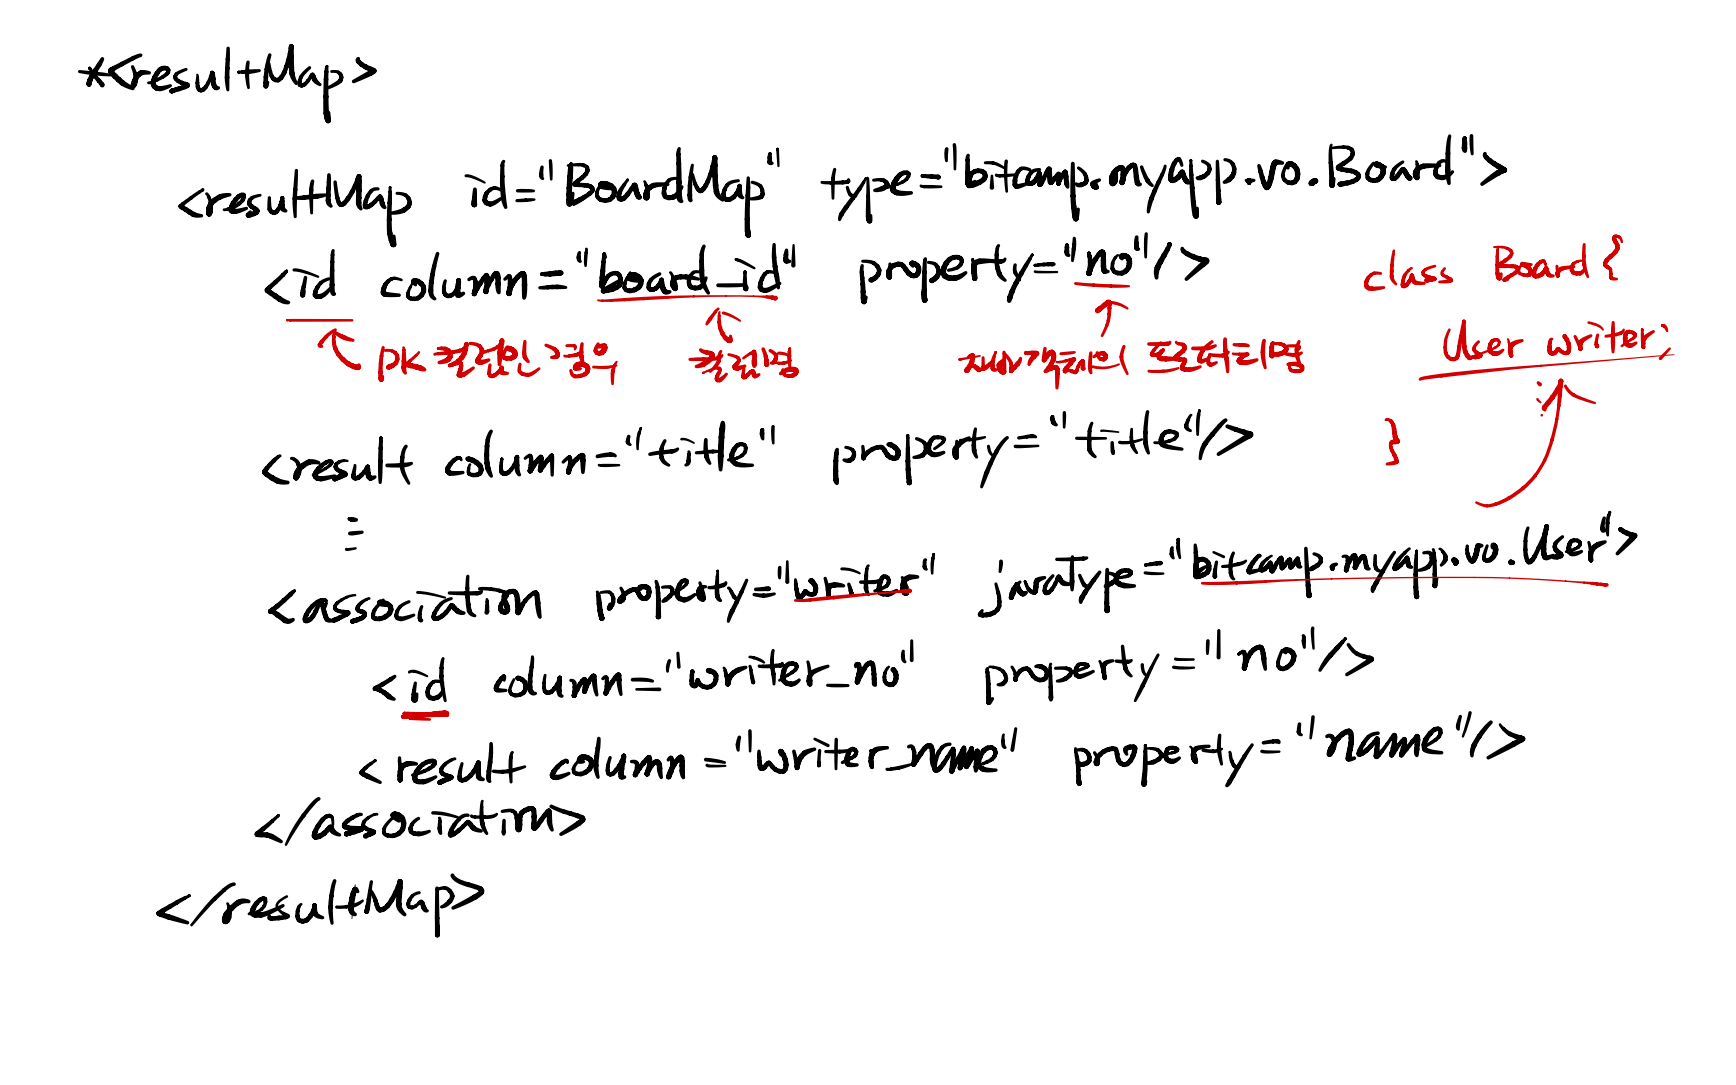
try {
sqlSession.insert();
sqlSession.commit();
}
catch() { sqlSession.rollback(); }

* 조인결과를 객체에 저장하기



*<resultMap>

```
<resultMap id="BoardMap" type="bitcamp.myapp.vo.Board">
    <id column="board_id" property="no" />
    <result column="title" property="title" />
      :
    <association property="writer" javaType="bitcamp.myapp.vo.User">
        <id column="writer_no" property="no" />
        <result column="writer_name" property="name" />
    </association>
</resultMap>
```



* XML (Extensible Markup Language) — 데이터를 구조화시켜 저장

데이터 끼리 상하관계를 표현할 수 있다
